Logical operations:

→ A logical operators allows you to test for the truth of a condition. ~~Similar~~.

→ The fallowing table illustrates the SQL Logical operators.

Operator	meaning.
ALL	* Return true if all comparisons are true
AND.	* Return true if both expressions are true.
ANY.	* Return true if any one of the comparision is true
BETWEEN.	* Return true if the operand is within a range.
~~EXISTS~~ IN.	* Return true if the operand is equal to one of the value in a list
~~IN~~. EXISTS	* Return true if the sub query contains any rows

1. AND: The AND operator allows you to construct multiple conditions in the WHERE clause of an SQL statement such as select.

→ The fallowing example finds all employees whose salaries are greater than 5000 and less than 7,000

> Select first_name, last_name, salary from employees where salary >=5000 AND salary <7000 order by salary;

output:

first_name	last_name	salary
John	wesly.	6000
eden	daniel	6000
Loies	popp	6900
shanta	suji	6500

2. ALL: The ALL operator compares a value to all values in anthor value set.

→ The fallowing example finds all employees whose salaries are greater than all salaries of employees

> Select first_name, last_name, salary from employees where salary >= ALL (select salary from employees where department_id = 8) order by salary DESC;

output:

first_name	last_name	salary.
steven	king	24000
John	Russel.	17000
Neena	kochhar.	14000

3. ANY: the ANY operator compares a value to any value in a set according to condition.

The fallowing example statement finds all employees whose salaries are greaterthan the average salary of every department.

> select first_name, last_name, salary from employees where salary > ANY (select Avg(salary) from employees group by department_id) order by first_name, last_name;

output:

first_name	last_name	salary
Alexander	Hunold	9000.00
charles	Johnson	6200.00
david	Austin	4800.00
~~Nelson~~ eden.	Flip.	9000.00

4. Between: the between operator searches for values that are with in a set of values.

→ For example, the fallowing statement finds all employees whoose salaries are between 9000 And 12000.

> Select first_name, last_name, salary from employees where salary between 9000 AND 12000 order by salary;

output:

First_name	last_name	salary
Alexander	Hunold	9000.00
Den	Rechards	10000.00
Nancy	prince	12000.00

19

5 IN: The IN operator compares a value to a list of specified values. The IN operator returns true if the compared value matches at least one value in the list.

→ The following statement finds all employees who work in the department id 8 or 9.

> Select first_name, last_name, department_id from employees where department_id IN (8,9) order by department_id;

output:

First_name	last_name	department_id.
John	Russel.	8
Jack	livingstone	8.
steven	king	9
Neena	kochhar	9

6. EXISTS:- The EXISTS operator tests if a subquery contains any rows

→ for example, the following statement finds all employees who have dependents

> select first_name, last_name from employees e where EXISTS (select 1 From dependent d where d.employee_id = e.employee_id);

First_name	last_name
steven	king
Neena	kochhar
Alexander	Hunold.
